

You can select and export an existing volume to an image by following the steps below:

:::note

If the volume is in external storage, ensure that it is not attached to workloads (virtual machines and pods) before starting the export process. This prevents the resulting image from getting stuck in the *Exporting* state.

:::

1. Click the  button and select the **Export Image** option.

2. Select the **Namespace** of the new image.
3. Configure the **Name** of the new image.
4. Select an existing **StorageClass** .
5. (Optional) You can download the exported image from the **Images** page by clicking the  button and selecting the **Download** option.
